J8 2003d OCLC Number: (OCOlc)53809237 Subject: Human cloning -- Research -- Government policy -- United States. Excerpt: . . . 11 Any biology textbook will define a human ovum or egg as a single cell. Moreover, it is a very unusual cell, a gamete cell, which means it has only 23 active chromosomes, half the number. Gender has not yet been determined. An ovum cannot grow stem cells or otherwise develop because it is just an egg. However, once an egg contains a complete nucleus, the full set of chromosomes from any species that is activated and developing, whether that has occurred by sexual fertilization or by asexual somatic cell nuclear transfer, then one has a developing embryo of that species, whether it is a sheep in the case of Dolly, which was asexual reproduction, or whether it is a cow or whether it is a homo sapiens. There is no such thing in biology or in any dictionary as a human egg or egg cell that has 46 chromosomes, has been determined to be either male or female and is 5 days old, consisting of several hundred cells, or 14 days old consisting of several thousand cells. Calling a 5-day-old or a 2-week-old human embryo an egg is an attempt really to hide the fact that this is an embryo and it is the true nature of a human clone, just as Dolly was at that stage a clone of a sheep. The phrase unfertilized blastocyst is likewise being used in this debate. Now, the term blastocyst, of course, refers to a stage of embryonic development, and an egg would never be a blastocyst. You are at an embryo stage. Human...
